### 1. Characteristics and classification of living organisms

#### 1.1 Characteristics of living organisms

**Core**

Describe the characteristics of living organisms by defining the terms:

- movement as an action by an organism causing a change of position or place
- respiration as the chemical reactions in cells that break down nutrient molecules and release energy for metabolism
- sensitivity as the ability to detect or sense stimuli in the internal or external environment and to make appropriate responses
- growth as a permanent increase in size and dry mass by an increase in cell number or cell size or both
- excretion as removal from organisms of the waste products of metabolism (chemical reactions in cells including respiration), toxic materials, and substances in excess of requirements
- nutrition as taking in of materials for energy, growth and development

**Supplement**

Define the terms:

- movement as an action by an organism or part of an organism causing a change of position or place
- respiration as the chemical reactions in cells that break down nutrient molecules and release energy for metabolism
- sensitivity as the ability to detect or sense stimuli in the internal or external environment and to make appropriate responses
- growth as a permanent increase in size and dry mass by an increase in cell number or cell size or both
- excretion as removal from organisms of toxic materials and substances in excess of requirements
- nutrition as taking in of materials for energy, growth and development; plants require light, carbon dioxide, water and ions; animals need organic compounds and ions and usually need water

#### 1.2 Concept and use of a classification system

**Core**

- State that organisms can be classified into groups by the features that they share
- Define species as a group of organisms that can reproduce to produce fertile offspring
- Define and describe the binomial system of naming species as an internationally agreed system in which the scientific name of an organism is made up of two parts showing the genus and species

**Supplement**

- Explain that classification systems aim to reflect evolutionary relationships
- Explain that classification is traditionally based on studies of morphology and anatomy
- Explain that the sequences of bases in DNA and of amino acids in proteins are used as a more accurate means of classification
- Explain that organisms which share a more recent ancestor (are more closely related) have base sequences in DNA that are more similar than those that share only a distant ancestor
## 1.3 Features of organisms

### Core

- List the features in the cells of all living organisms, limited to cytoplasm, cell membrane and DNA as genetic material
- List the main features used to place animals and plants into the appropriate kingdoms
- List the main features used to place organisms into groups within the animal kingdom, limited to:
  - the main groups of vertebrates: mammals, birds, reptiles, amphibians, bony fish
  - the main groups of arthropods: myriapods, insects, arachnids, crustaceans

### Supplement

- List the features in the cells of all living organisms, limited to ribosomes for protein synthesis and enzymes involved in respiration
- List the main features used to place all organisms into one of the five kingdoms: Animal, Plant, Fungus, Prokaryote, Protocist
- List the main features used to place organisms into groups within the plant kingdom, limited to ferns and flowering plants (dicotyledons and monocotyledons)
- List the features of viruses, limited to protein coat and genetic material

## 1.4 Dichotomous keys

### Core

- Construct and use simple dichotomous keys based on easily identifiable features

## 2. Organisation and maintenance of the organism

### 2.1 Cell structure and organisation

#### Core

- Describe and compare the structure of a plant cell with an animal cell, as seen under a light microscope, limited to cell wall, nucleus, cytoplasm, chloroplasts, vacuoles and location of the cell membrane
- State the functions of the structures seen under the light microscope in the plant cell and in the animal cell

#### Supplement

- State that the cytoplasm of all cells contains structures, limited to ribosomes on rough endoplasmic reticulum and vesicles
- State that almost all cells, except prokaryotes, have mitochondria and rough endoplasmic reticulum
- Identify mitochondria and rough endoplasmic reticulum in diagrams and images of cells
- State that aerobic respiration occurs in mitochondria
- State that cells with high metabolism require large numbers of mitochondria to provide sufficient energy

## 2.2 Levels of organisation

### Core

- Relate the structure of the following to their functions:
  - ciliated cells: movement of mucus in the trachea and bronchi
  - root hair cells: absorption
  - xylem vessels: conduction and support
  - palisade mesophyll cells: photosynthesis
  - nerve cells: conduction of impulses
  - red blood cells: transport of oxygen
  - sperm and egg cells: reproduction
- Define tissue as a group of cells with similar structures, working together to perform a shared function  
  Pages 24–25
- Define organ as a structure made up of a group of tissues, working together to perform specific functions  
  Pages 24–25
- Define organ system as a group of organs with related functions, working together to perform body functions  
  Pages 24–25
- State examples of tissues, organs and organ systems from sections 6 to 16  
  Pages 24–25
- Identify the different levels of organisation in drawings, diagrams and images of familiar material  
  Pages 24–25

**Supplement**
- Identify the different levels of organisation in drawings, diagrams and images of unfamiliar material  
  Pages 24–25

### 2.3 Size of specimens

**Core**
- Calculate magnification and size of biological specimens using millimetres as units  
  Pages 20–21

**Supplement**
- Calculate magnification and size of biological specimens using millimetres and micrometres as units  
  Pages 20–21

### 3. Movement in and out of cells

#### 3.1 Diffusion

**Core**
- Define diffusion as the net movement of particles from a region of their higher concentration to a region of their lower concentration down a concentration gradient, as a result of their random movement  
  Pages 28–29
- Describe the importance of diffusion of gases and solutes  
  Pages 28–29
- State that substances move in and out of cells by diffusion through the cell membrane  
  Pages 28–29

**Supplement**
- State that the energy for diffusion comes from the kinetic energy of random movement of molecules and ions  
  Pages 28–29
- Investigate the factors that influence diffusion, limited to surface area, temperature, concentration gradients and distance  
  Pages 28–29

#### 3.2 Osmosis

**Core**
- State that water diffuses through partially permeable membranes by osmosis  
  Pages 30–33
- State that water moves in and out of cells by osmosis through the cell membrane  
  Pages 30–33
- Investigate and describe the effects on plant tissues of immersing them in solutions of different concentrations  
  Pages 30–33
- State that plants are supported by the pressure of water inside the cells pressing outwards on the cell wall  
  Pages 30–33

**Supplement**
- Define osmosis as the net movement of water molecules from a region of higher water potential (dilute solution) to a region of lower water potential (concentrated solution), through a partially permeable membrane  
  Pages 30–33
- Explain the effects on plant tissues of immersing them in solutions of different concentrations by using the terms turgid, turgor pressure, plasmolysis and flaccid  
  Pages 30–33
### 3.3 Active transport

**Core**
- Define active transport as the movement of particles through a cell membrane from a region of lower concentration to a region of higher concentration using the energy from respiration

**Supplement**
- Discuss the importance of active transport as a process for movement across membranes:
  - e.g. ion uptake by root hairs and uptake of glucose by epithelial cells of villi and kidney tubules
- Explain how protein molecules move particles across a membrane during active transport

### 4. Biological molecules

**Core**
- List the chemical elements that make up:
  - carbohydrates
  - fats
  - proteins
- State that large molecules are made from smaller molecules, limited to:
  - starch and glycogen from glucose
  - cellulose from glucose
  - proteins from amino acids
  - fats and oils from fatty acids and glycerol
- Describe the use of:
  - iodine solution to test for starch
  - Benedict's solution to test for reducing sugars
  - biuret test for proteins
  - ethanol emulsion test for fats and oils
  - DCPIP test for vitamin C
- State that water is important as a solvent

**Supplement**
- Explain that different sequences of amino acids give different shapes to protein molecules
- Relate the shape and structure of protein molecules to their function, limited to the active site of enzymes and the binding site of antibodies
- Describe the structure of DNA as:
  - two strands coiled together to form a double helix
  - each strand contains chemicals called bases
  - cross-links between the strands are formed by pairs of bases
  - the bases always pair up in the same way: A with T, and C with G (full names are not required)
- Describe the roles of water as a solvent in organisms with respect to digestion, excretion and transport
### 5. Enzymes

<table>
<thead>
<tr>
<th>Core</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Define the term catalyst as a substance that increases the rate of a chemical reaction and is not changed by the reaction</td>
<td>46–47</td>
</tr>
<tr>
<td>• Define enzymes as proteins that function as biological catalysts</td>
<td>48–49</td>
</tr>
<tr>
<td>• Describe why enzymes are important in all living organisms in terms of reaction speed necessary to sustain life</td>
<td>46–47</td>
</tr>
<tr>
<td>• Describe enzyme action with reference to the complementary shape of an enzyme and its substrate and the formation of a product (knowledge of the term active site is not required)</td>
<td>50–51</td>
</tr>
<tr>
<td>• Investigate and describe the effect of changes in temperature and pH on enzyme activity</td>
<td>48–49</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Supplement</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Explain enzyme action with reference to the active site, enzyme-substrate complex, substrate and product</td>
<td>46–47</td>
</tr>
<tr>
<td>• Explain the specificity of enzymes in terms of the complementary shape and fit of the active site with the substrate</td>
<td>48–49</td>
</tr>
<tr>
<td>• Explain the effect of changes in temperature on enzyme activity in terms of kinetic energy, shape and fit, frequency of effective collisions and denaturation</td>
<td>50–51</td>
</tr>
<tr>
<td>• Explain the effect of changes in pH on enzyme activity in terms of shape and fit and denaturation</td>
<td>50–51</td>
</tr>
</tbody>
</table>

### 6. Plant nutrition

#### 6.1 Photosynthesis

<table>
<thead>
<tr>
<th>Core</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Define photosynthesis as the process by which plants manufacture carbohydrates from raw materials using energy from light</td>
<td>54–55</td>
</tr>
<tr>
<td>• State the word equation for photosynthesis: carbon dioxide + water → glucose + oxygen, in the presence of light and chlorophyll</td>
<td>56–57</td>
</tr>
<tr>
<td>• Investigate the necessity for chlorophyll, light and carbon dioxide for photosynthesis, using appropriate controls</td>
<td>60–61</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Supplement</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>• State the balanced chemical equation for photosynthesis</td>
<td>58–59</td>
</tr>
</tbody>
</table>
| \[
\text{(light} \quad 6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow{\text{Chlorophyll}} \text{C}_6\text{H}_12\text{O}_6 + 6\text{O}_2)\]
| • Explain that chlorophyll transfers light energy into chemical energy in molecules, for the synthesis of carbohydrates | 58–59 |
| • Outline the subsequent use and storage of the carbohydrates made in photosynthesis | 58–59 |
| • Define the term limiting factor as something present in the environment in such short supply that it restricts life processes | 62–63 |
| • Identify and explain the limiting factors of photosynthesis in different environmental conditions | 66–67 |
| • Describe the use of carbon dioxide enrichment, optimum light and optimum temperatures in glasshouses in temperate and tropical countries | 62–63 |
| • Use hydrogen carbonate indicator solution to investigate the effect of gas exchange of an aquatic plant kept in the light and in the dark | 66–67 |
### 6.2 Leaf structure

**Core**
- Identify chloroplasts, cuticle, guard cells and stomata, upper and lower epidermis, palisade mesophyll, spongy mesophyll, vascular bundles, xylem and phloem in leaves of a dicotyledonous plant

**Supplement**
- Explain how the internal structure of a leaf is adapted for photosynthesis

### 6.3 Minerals

**Core**
- Describe the importance of:
  - nitrate ions for making amino acids
  - magnesium ions for making chlorophyll

**Supplement**
- Explain the effects of nitrate ion and magnesium ion deficiency on plant growth

### 7. Human nutrition

#### 7.1 Diet

**Core**
- State what is meant by the term balanced diet for humans
- Explain how age, gender and activity affect the dietary needs of humans including during pregnancy and whilst breast-feeding
- Describe the effects of malnutrition in relation to starvation, constipation, coronary heart disease, obesity and scurvy
- List the principal sources of, and describe the dietary importance of:
  - carbohydrates
  - fats
  - proteins
  - vitamins, limited to C and D
  - mineral salts, limited to calcium and iron
  - fibre (roughage)
  - water

**Supplement**
- Explain the causes and effects of vitamin D and iron deficiencies
- Explain the causes and effects of protein-energy malnutrition, e.g. kwashiorkor and marasmus

#### 7.2 Alimentary canal

**Core**
- Define ingestion as the taking of substances, e.g. food and drink, into the body through the mouth
- Define mechanical digestion as the breakdown of food into smaller pieces without chemical change to the food molecules
- Define chemical digestion as the breakdown of large, insoluble molecules into small, soluble molecules
- Define absorption as the movement of small food molecules and ions through the wall of the intestine into the blood
### Define assimilation as the movement of digested food molecules into the cells of the body where they are used, becoming part of the cells

### Define egestion as the passing out of food that has not been digested or absorbed, as faeces, through the anus

### Describe diarrhoea as the loss of watery faeces

### Outline the treatment of diarrhoea using oral rehydration therapy

### Describe cholera as a disease caused by a bacterium

### Identify the main regions of the alimentary canal and associated organs, limited to mouth, salivary glands, oesophagus, stomach, small intestine (duodenum and ileum), pancreas, liver, gall bladder and large intestine (colon, rectum, anus)

### Describe the functions of the regions of the alimentary canal listed above, in relation to ingestion, digestion, absorption, assimilation and egestion of food

### Supplement

- Explain that the cholera bacterium produces a toxin that causes secretion of chloride ions into the small intestine, causing osmotic movement of water into the gut, causing eutratil, dehydration and loss of salts from blood

### 7.3 Mechanical digestion

#### Core

- Identify the types of human teeth (incisors, canines, premolars and molars)
- Describe the structure of human teeth, limited to enamel, dentine, pulp, nerves and cement, as well as the gums
- Describe the functions of the types of human teeth in mechanical digestion of food
- Describe the proper care of teeth in terms of diet and regular brushing

### 7.4 Chemical digestion

#### Core

- State the significance of chemical digestion in the alimentary canal in producing small, soluble molecules that can be absorbed
- State the functions of enzymes as follows:
  - amylase breaks down starch to simpler sugars
  - protease breaks down protein to amino acids
  - lipase breaks down fats to fatty acids and glycerol
- State where, in the alimentary canal, amylase, protease and lipase are secreted
- State the functions of the hydrochloric acid in gastric juice, limited to killing bacteria in food and giving an acid pH for enzymes
### Supplement

- **Describe the digestion of starch in the alimentary canal:**
  - Amylase is secreted into the alimentary canal and breaks down starch to maltose.
  - Maltose is broken down by maltase to glucose on the membranes of the epithelium lining the small intestine.
- **Describe pepsin and trypsin as two protease enzymes that function in different parts of the alimentary canal:**
  - Pepsin in the stomach.
  - Trypsin in the small intestine.
- **Explain the functions of the hydrochloric acid in gastric juice, limited to the low pH:**
  - Denaturing enzymes in harmful microorganisms in food.
  - Giving the optimum pH for pepsin activity.
- **Outline the role of bile in neutralizing the acidic mixture of food and gastric juices entering the duodenum from the stomach, to provide a suitable pH for enzyme action.**
- **Outline the role of bile in emulsifying fats to increase the surface area for the chemical digestion of fat to fatty acids and glycerol by lipase.**

### 7.5 Absorption

#### Core

- Identify the small intestine as the region for the absorption of digested food.
- State that water is absorbed in both the small intestine and the colon, but that most absorption of water happens in the small intestine.

#### Supplement

- Explain the significance of villi in increasing the internal surface area of the small intestine.
- Describe the structure of a villus.
- Describe the roles of capillaries and lacteals in villi.

### 8. Transport in plants

#### 8.1 Transport in plants

#### Core

- State the functions of xylem and phloem.
- Identify the position of xylem and phloem as seen in sections of roots, stems and leaves, limited to non-woody dicotyledonous plants.

#### 8.2 Water uptake

#### Core

- Identify root hair cells, as seen under the light microscope, and state their functions.
- State the pathway taken by water through root, stem and leaf as root hair cell, root cortex cells, xylem and mesophyll cells.
- Investigate, using a suitable stain, the pathway of water through the above ground parts of a plant.

#### Supplement

- Explain that the large surface area of root hairs increases the rate of the absorption of water by osmosis and ions by active transport.
### 8.3 Transpiration

#### Core
- State that water is transported from the roots to leaves through the xylem vessels
- Define transpiration as loss of water vapour from plant leaves by evaporation of water at the surfaces of the mesophyll cells followed by diffusion of water vapour through the stomata
- Investigate and describe the effects of variation of temperature and humidity on transpiration rate

#### Supplement
- Explain how water vapour loss is related to the large surface area of cell surfaces, interconnecting air spaces and stomata
- Explain the mechanism by which water moves upwards in the xylem in terms of a transpiration pull that draws up a column of water molecules, held together by cohesion
- Explain how and why wilting occurs
- Explain the effects of variation of temperature and humidity on transpiration rate

### 8.4 Translocation

#### Supplement
- Define translocation in terms of the movement of sucrose and amino acids in phloem:
  - from regions of production (source)
  - to regions of storage OR to regions where they are used in respiration or growth (sink)
- Explain that some parts of a plant may act as a source and a sink at different times during the life of a plant

### 9. Transport in animals

#### 9.1 Transport in animals

#### Core
- Describe the circulatory system as a system of blood vessels with a pump and valves to ensure one-way flow of blood

#### Supplement
- Describe the single circulation of a fish
- Describe the double circulation of a mammal
- Explain the advantages of a double circulation

#### 9.2 Heart

#### Core
- Name and identify the structures of the mammalian heart, limited to the muscular wall, the septum, the left and right ventricles and atria, one-way valves and coronary arteries
- State that blood is pumped away from the heart into arteries and returns to the heart in veins
- State that the activity of the heart may be monitored by ECG, pulse rate and listening to sounds of valves closing
- Investigate and state the effect of physical activity on the pulse rate
- Describe coronary heart disease in terms of the blockage of coronary arteries and state the possible risk factors as diet, stress, smoking, genetic predisposition, age and gender
### Supplement

- Name and identify the atrioventricular and semilunar valves in the mammalian heart  
  Pages 102–103
- Explain the relative thickness:  
  - of the muscle wall of the left and right ventricles  
  - of the muscle wall of the atria compared to that of the ventricles  
  Pages 102–103
- Explain the importance of the septum in separating oxygenated and deoxygenated blood  
  Pages 102–103
- Describe the functioning of the heart in terms of the contraction of muscles of the atria and ventricles and the action of the valves  
  Pages 102–103
- Explain the effect of physical activity on the heart rate  
  Pages 104–105
- Discuss the roles of diet and exercise in the prevention of coronary heart disease  
  Pages 108–109
- Describe ways in which coronary heart disease may be treated, limited to drug treatment with aspirin and surgery (stents, angioplasty and by-pass)  
  Pages 108–109

### 9.3 Blood and lymphatic system

**Core**

- Describe the structure and functions of arteries, veins and capillaries  
  Pages 106–107
- Name the main blood vessels to and from the:  
  - heart, limited to vena cava, aorta, pulmonary artery and pulmonary vein  
  - lungs, limited to the pulmonary artery and pulmonary vein  
  - kidney, limited to the renal artery and renal vein  
  Pages 106–107

**Supplement**

- Explain how the structures of arteries, veins and capillaries are adapted for their functions  
  Pages 106–107
- State the function of arterioles, venules and shunt vessels  
  Pages 106–107
- Outline the lymphatic system in terms of lymphatic vessels and lymph nodes  
  Pages 114–115
- Describe the function of the lymphatic system in the circulation of body fluids and the protection of the body from infection  
  Pages 114–115

### 9.4 Blood

**Core**

- List the components of blood as red blood cells, white blood cells, platelets and plasma  
  Pages 110–111
- Identify red and white blood cells, as seen under the light microscope, on prepared slides and in diagrams and photomicrographs  
  Pages 110–111
- State the functions of the following components of blood:  
  - red blood cells in transporting oxygen, including the role of haemoglobin  
  - white blood cells in phagocytosis and antibody production  
  - platelets in clotting (details are not required)  
  - plasma in the transport of blood cells, ions, soluble nutrients, hormones and carbon dioxide  
  Pages 110–113

**Supplement**

- Identify lymphocyte and phagocyte white blood cells, as seen under the light microscope, on prepared slides and in diagrams and photomicrographs  
  Pages 112–113
- State the functions of:  
  - lymphocytes  
  - antibody production  
  - phagocytes  
  - phagocytosis  
  Pages 112–113
- Describe the process of clotting as the conversion of fibrinogen to fibrin to form a mesh  
  Pages 112–113
### 10. Diseases and immunity

#### 7.1 Diet

**Core**

- Define pathogen as a disease-causing organism
- Define transmissible disease as a disease in which the pathogen can be passed from one host to another
- State that the pathogen for a transmissible disease may be transmitted either through direct contact, e.g. through blood or other body fluids, or indirectly, e.g. from contaminated surfaces or food, from animals, or from the air

**Supplement**

- State that the body has defences:
  - mechanical barriers, limited to skin and hairs in the nose
  - chemical barriers, limited to mucus and stomach acid
  - cells, limited to phagocytosis and antibody production by white blood cells
  - which can be enhanced by vaccination
- Explain the importance of hygienic food preparation, good personal hygiene, waste disposal and sewage treatment in controlling the spread of disease

**Pages**

- Pages 114–115
- Pages 118–119
- Pages 120–121
- Pages 128–129

### 11. Gas exchange in humans

**Core**

- List the features of gas exchange surfaces in humans, limited to large surface area, thin surface, good blood supply and good ventilation with air
- Name and identify the lungs, diaphragm, ribs, intercostal muscles, larynx, trachea, bronchi, bronchioles, alveoli and associated capillaries

**Pages**

- Pages 128–129
- State the differences in composition between inspired and expired air, limited to oxygen, carbon dioxide and water vapour
- Use limewater as a test for carbon dioxide to investigate the differences in composition between inspired and expired air
- Investigate and describe the effects of physical activity on rate and depth of breathing

**Supplement**

- Name and identify the internal and external intercostal muscles
- State the functions of the cartilage in the trachea
- Explain the role of the ribs, the internal and external intercostal muscles and the diaphragm in producing volume and pressure changes leading to the ventilation of the lungs
- Explain the differences in composition between inspired and expired air
- Explain the link between physical activity and rate and depth of breathing in terms of the increased carbon dioxide concentration in the blood, detected by the brain, causing an increased rate of breathing
- Explain the role of goblet cells, mucus and ciliated cells in protecting the gas exchange system from pathogens and particles.

<table>
<thead>
<tr>
<th>12. Respiration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>12.1 Respiration</strong></td>
</tr>
<tr>
<td><strong>Core</strong></td>
</tr>
</tbody>
</table>
- State the uses of energy in the body of humans: muscle contraction, protein synthesis, cell division, active transport, growth, the passage of nerve impulses and the maintenance of a constant body temperature
- State that respiration involves the action of enzymes in cells

<table>
<thead>
<tr>
<th>12.2 Aerobic respiration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Core</strong></td>
</tr>
</tbody>
</table>
- Define aerobic respiration as the chemical reactions in cells that use oxygen to break down nutrient molecules to release energy
- State the word equation for aerobic respiration as: glucose + oxygen → carbon dioxide + water
- Investigate the uptake of oxygen by respiring organisms, such as arthropods and germinating seeds

<table>
<thead>
<tr>
<th><strong>Supplement</strong></th>
</tr>
</thead>
</table>
- State the balanced chemical equation for aerobic respiration as C₆H₁₂O₆ + 6O₂ → 6CO₂ + 6H₂O
- Investigate the effect of temperature on the rate of respiration of germinating seeds

<table>
<thead>
<tr>
<th>12.3 Anaerobic respiration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Core</strong></td>
</tr>
</tbody>
</table>
- Define anaerobic respiration as the chemical reactions in cells that break down nutrient molecules to release energy without using oxygen
- State the word equations for anaerobic respiration in muscles during vigorous exercise (glucose → lactic acid) and the microorganism yeast (glucose → alcohol + carbon dioxide)
- State that anaerobic respiration releases much less energy per glucose molecule than aerobic respiration.
### Supplement

- State the balanced chemical equation for anaerobic respiration in the microorganism yeast as  
  \( C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2 \)  
- State that lactic acid builds up in muscles and blood during vigorous exercise causing an oxygen debt  
- Outline how the oxygen debt is removed during recovery, limited to:  
  - aerobic respiration of lactic acid in the liver  
  - continuation, after exercise, of fast heart rate to transport lactic acid in blood from muscles to the liver  
  - continuation, after exercise, of deeper breathing supplying oxygen for aerobic respiration of lactic acid

### 13. Excretion in humans

#### Core

- State that urea is formed in the liver from excess amino acids  
- State that carbon dioxide is excreted through the lungs  
- State that the kidneys excrete urea and excess water and salts  
- Explain that the volume and concentration of urine produced is affected by water intake, temperature and exercise  
- Identify on drawings, diagrams and images, the ureters, bladder and urethra

#### Supplement

- Describe the role of the liver in the assimilation of amino acids by converting them to proteins, including plasma proteins, e.g. fibrinogen  
- Define deamination as the removal of the nitrogen-containing part of amino acids to form urea  
- Explain the need for excretion, limited to toxicity of urea and carbon dioxide  
- Outline the structure of the kidney, limited to the cortex, medulla and ureter  
- Outline the structure and functioning of a kidney tubule, including:  
  - the role of the glomerulus in the filtration from the blood of water, glucose, urea and salts  
  - the role of the tubule in the reabsorption of all of the glucose, most of the water and some salts back into the blood, leading to the concentration of urea in the urine as well as loss of excess water and salts (details of these processes are not required)  
- Explain dialysis in terms of the maintenance of the glucose and protein concentration in the blood and the diffusion of urea from the blood to the dialysis fluid  
- Describe the use of dialysis in kidney machines  
- Discuss the advantages and disadvantages of kidney transplants, compared with dialysis

### 14. Coordination and response

#### 14.1 Nervous control in humans

#### Core

- Describe a nerve impulse as an electrical signal that passes along nerve cells called neurones  
- Describe the human nervous system in terms of:  
  - the central nervous system consisting of brain and spinal cord  
  - the peripheral nervous system  
  - coordination and regulation of body functions  
- Identify motor (effector), relay (connector) and sensory neurones from diagrams
### 14.2 Sense organs

#### Core
- Define sense organs as groups of receptor cells responding to specific stimuli: light, sound, touch, temperature and chemicals
- Identify the structures of the eye, limited to cornea, iris, pupil, lens, retina, optic nerve and blind spot
- Describe the function of each part of the eye, limited to:
  - cornea – refracts light
  - iris – controls how much light enters pupil
  - lens – focuses light onto retina
  - retina – contains light receptors, some sensitive to light of different colours
  - optic nerve – carries impulses to the brain
- Explain the pupil reflex in terms of light intensity and pupil diameter only

#### Supplement
- Explain the pupil reflex in terms of light intensity and antagonistic action of circular and radial muscles in the iris
- Explain accommodation to view near and distant objects in terms of the contraction and relaxation of the ciliary muscles, tension in the suspensory ligaments, shape of the lens and refraction of light
- State the distribution of rods and cones in the retina of a human
- Outline the function of rods and cones, limited to greater sensitivity of rods for night vision and three different kinds of cones absorbing light of different colours for colour vision
- Identify the position of the fovea

### 14.3 Hormones in humans

#### Core
- Define a hormone as a chemical substance, produced by a gland and carried by the blood, which alters the activity of one or more specific target organs
- Identify specific endocrine glands and their secretions, limited to adrenal glands and adrenaline, pancreas and insulin, testes and testosterone and ovaries and oestrogen
- Describe adrenaline as the hormone secreted in ‘fight or flight’ situations and its effects, limited to increased breathing and pulse rate and widened pupils
- Give examples of situations in which adrenaline secretion increases
- State the functions of insulin, oestrogen and testosterone

**Supplement**

- Discuss the role of the hormone adrenaline in the chemical control of metabolic activity, including increasing the blood glucose concentration and pulse rate  
  Pages 164–165
- Compare nervous and hormonal control systems in terms of speed and longevity of action  
  Pages 164–165

**14.4 Homeostasis**

**Core**

- Define homeostasis as the maintenance of a constant internal environment  
  Pages 166–167
- Name and identify on a diagram of the skin: hairs, hair erector muscles, sweat glands, receptors, sensory neurones, blood vessels and fatty tissue  
  Pages 168–169
- Describe the maintenance of a constant internal body temperature in humans in terms of insulation, sweating, shivering and the role of the brain (limited to blood temperature receptors and coordination)  
  Pages 168–169

**Supplement**

- Explain that homeostasis is the control of internal conditions within set limits  
  Pages 166–167
- Explain the concept of control by negative feedback  
  Pages 166–167
- Describe the control of the glucose concentration of the blood by the liver and the roles of insulin and glucagon from the pancreas  
  Pages 166–167
- Outline the symptoms and treatment of Type 1 diabetes (detail of β cells is not required)  
  Pages 122–123
- Describe the maintenance of a constant internal body temperature in humans in terms of vasodilation and vasoconstriction of arterioles supplying skin surface capillaries  
  Pages 168–169

**14.5 Tropic responses**

**Core**

- Define gravitropism as a response in which parts of a plant grow towards or away from gravity  
  Pages 170–171
- Define phototropism as a response in which parts of a plant grow towards or away from the direction from which light is coming  
  Pages 170–171
- Investigate gravitropism and phototropism in shoots and roots  
  Pages 170–171

**Supplement**

- Explain phototropism and gravitropism of a shoot as examples of the chemical control of plant growth  
  Pages 170–171
- Explain the role of auxin in controlling shoot growth, limited to:  
  - auxin made in shoot tip (only) – auxin spreads through the plant from the shoot tip  
  - auxin is unequally distributed in response to light and gravity  
  - auxin stimulates cell elongation  
  Pages 170–171
- Describe the use in weedkillers of the synthetic plant hormone 2,4-D  
  Pages 170–171

**15. Drugs**

**15.1 Drugs**

**Core**

- Define a drug as any substance taken into the body that modifies or affects chemical reactions in the body  
  Pages 174–175
### 15.2 Medicinal drugs

**Core**
- Describe the use of antibiotics for the treatment of bacterial infection
- State that some bacteria are resistant to antibiotics which reduces the effectiveness of antibiotics
- State that antibiotics kill bacteria but do not affect viruses

**Supplement**
- Explain how development of resistant bacteria such as MRSA can be minimised, limited to using antibiotics only when essential and ensuring treatment is completed
- Explain why antibiotics kill bacteria, but do not affect viruses

### 15.3 Misused drugs

**Core**
- Describe the effects of excessive alcohol consumption and abuse of heroin, limited to:
  - powerful depressant drugs
  - effect on reaction times and self-control
  - addiction and withdrawal symptoms
  - negative social implications, e.g. crime
- State that injecting heroin can cause infections such as HIV
- State that excessive alcohol consumption can cause liver damage
- State that tobacco smoking can cause chronic obstructive pulmonary disease (COPD), lung cancer and coronary heart disease
- Describe the effects on the gas exchange system of tobacco smoke and its major toxic components, limited to carbon monoxide, nicotine and tar
- State that the liver is the site of breakdown of alcohol and other toxins

**Supplement**
- Explain how heroin affects the nervous system, limited to its effect on the function of synapses
- Discuss the evidence for the link between smoking and lung cancer
- Discuss the use of hormones to improve sporting performance, limited to testosterone and anabolic steroids

### 16. Reproduction

#### 16.1 Asexual reproduction

**Core**
- Define asexual reproduction as a process resulting in the production of genetically identical offspring from one parent
- Identify examples of asexual reproduction from information provided

**Supplement**
- Discuss the advantages and disadvantages of asexual reproduction:
  - to a population of a species in the wild
  - to crop production
### 16.2 Sexual reproduction

<table>
<thead>
<tr>

### 16.4 Sexual reproduction in humans

<table>
<thead>
<tr>
<th>Core</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identify and name on diagrams of the male reproductive system: the testes, scrotum, sperm ducts, prostate gland, urethra and penis, and state the functions of these parts</td>
<td>192–193</td>
</tr>
<tr>
<td>Identify and name on diagrams of the female reproductive system: the ovaries, oviducts, uterus, cervix and vagina, and state the functions of these parts</td>
<td>194–195</td>
</tr>
<tr>
<td>Describe fertilisation as the fusion of the nuclei from a male gamete (sperm) and a female gamete (egg cell/ovum)</td>
<td>196–197</td>
</tr>
<tr>
<td>State the adaptive features of sperm, limited to flagellum and the presence of enzymes</td>
<td>192–193</td>
</tr>
<tr>
<td>State the adaptive features of egg cells, limited to energy stores and a jelly coating that changes after fertilisation</td>
<td>196–197</td>
</tr>
<tr>
<td>State that in early development, the zygote forms an embryo which is a ball of cells that implants into the wall of the uterus</td>
<td>196–197</td>
</tr>
<tr>
<td>State the functions of the umbilical cord, placenta, amniotic sac and amniotic fluid</td>
<td>198–199</td>
</tr>
<tr>
<td>Outline the growth and development of the fetus in terms of increasing complexity in the early stages and increasing size towards the end of pregnancy</td>
<td>198–199</td>
</tr>
</tbody>
</table>
- Describe the ante-natal care of pregnant women, limited to special dietary needs and the harm from smoking and alcohol consumption
- Outline the processes involved in labour and birth, limited to:
  - breaking of the amniotic sac
  - contraction of the muscles in the uterus wall
  - dilation of the cervix
  - passage through the vagina
  - tying and cutting the umbilical cord
  - delivery of the afterbirth

**Supplement**

- Compare male and female gametes in terms of size, structure, motility and numbers
- Explain the adaptive features of sperm, limited to flagellum, mitochondria and enzymes in the acrosome
- Explain the adaptive features of egg cells, limited to energy stores and the jelly coat that changes at fertilisation
- Describe the function of the placenta and umbilical cord in relation to exchange of dissolved nutrients, gases and excretory products and providing a barrier to toxins and pathogens (structural details are not required)
- State that some toxins, e.g. nicotine, and pathogens, e.g. rubella virus, can pass across the placenta and affect the fetus
- Discuss the advantages and disadvantages of breast-feeding compared with bottle-feeding using formula milk

### 16.5 Sex hormones in humans

**Core**

- Describe the roles of testosterone and oestrogen in the development and regulation of secondary sexual characteristics during puberty
- Describe the menstrual cycle in terms of changes in the ovaries and the lining of the uterus

**Supplement**

- Describe the sites of production of oestrogen and progesterone in the menstrual cycle and in pregnancy
- Explain the role of hormones in controlling the menstrual cycle and pregnancy, limited to FSH, LH, progesterone and oestrogen

### 16.6 Methods of birth control in humans

**Core**

- Outline the following methods of birth control:
  - natural, limited to abstinence, monitoring body temperature and cervical mucus
  - chemical, limited to IUD, IUS, contraceptive pill, implant and injection
  - barrier, limited to condom, femidom, diaphragm
  - surgical, limited to vasectomy and female sterilization

**Supplement**

- Outline the use of hormones in contraception and fertility treatments
- Outline artificial insemination (AI)
- Outline in vitro fertilisation (IVF)
- Discuss the social implications of contraception and fertility treatments
### 16.7 Sexually transmitted infections (STI)

**Core**

- Define sexually transmitted infection as an infection that is transmitted via body fluids through sexual contact
- State that human immunodeficiency virus (HIV) is an example of an STI
- Explain how the spread of STIs is controlled
- Describe the methods of transmission of HIV
- State that HIV infection may lead to AIDS

**Pages 210–211**

**Supplement**

- Outline how HIV affects the immune system, limited to decreased lymphocyte numbers and reduced ability to produce antibodies

**Pages 210–211**

### 17. Inheritance

#### 17.1 Inheritance

**Core**

- Define inheritance as the transmission of genetic information from generation to generation

**Pages 214–215**

#### 17.2 Chromosomes, genes and proteins

**Core**

- Define chromosome as a thread-like structure of DNA, carrying genetic information in the form of genes
- Define gene as a length of DNA that codes for a protein
- Define allele as a version of a gene
- Describe the inheritance of sex in humans with reference to XX and XY chromosomes

**Pages 214–215**

**Supplement**

- Explain that the sequence of bases in a gene is the genetic code for putting together amino acids in the correct order to make a specific protein (knowledge of the details of nucleotide structure is not required)
- Explain that DNA controls cell function by controlling the production of proteins (some of which are enzymes), antibodies and receptors for neurotransmitters
- Explain how a protein is made, limited to:
  - the gene coding for the protein remains in the nucleus
  - mRNA molecules carry a copy of the gene to the cytoplasm
  - the mRNA passes through ribosomes
  - the ribosome assembles amino acids into protein molecules
  - the specific order of amino acids is determined by the sequence of bases in the mRNA (knowledge of the details of transcription or translation is not required)
- Explain that all body cells in an organism contain the same genes, but many genes in a particular cell are not expressed because the cell only makes the specific proteins it needs
- Define a haploid nucleus as a nucleus containing a single set of unpaired chromosomes, e.g. in gametes
- Define a diploid nucleus as a nucleus containing two sets of chromosomes, e.g. in body cells
- State that in a diploid cell, there is a pair of each type of chromosome and in a human diploid cell there are 23 pairs

**Pages 216–217**

**Pages 222–223**
## 17.3 Mitosis

### Core
- Define mitosis as nuclear division giving rise to genetically identical cells (details of stages are not required)
- State the role of mitosis in growth, repair of damaged tissues, replacement of cells and asexual reproduction

### Supplement
- State that the exact duplication of chromosomes occurs before mitosis
- State that during mitosis, the copies of chromosomes separate, maintaining the chromosome number (details of stages of mitosis are not required)
- Describe stem cells as unspecialised cells that divide by mitosis to produce daughter cells that can become specialised for specific functions

### 17.4 Meiosis

### Core
- Define meiosis as nuclear division giving rise to cells that are genetically different (details of stages are not required)
- State that meiosis is involved in the production of gametes

### Supplement
- Define meiosis as reduction division in which the chromosome number is halved from diploid to haploid resulting in genetically different cells (details of stages are not required)
- Explain how meiosis produces variation by forming new combinations of maternal and paternal chromosomes (specific details are not required)

## 17.5 Monohybrid inheritance

### Core
- Define genotype as the genetic make-up of an organism in terms of the alleles present
- Define phenotype as the observable features of an organism
- Define homozygous as having two identical alleles of a particular gene
- State that two identical homozygous individuals that breed together will be pure-breeding
- Define heterozygous as having two different alleles of a particular gene
- State that a heterozygous individual will not be pure-breeding
- Define dominant as an allele that is expressed if it is present
- Define recessive as an allele that is only expressed when there is no dominant allele of the gene present
- Interpret pedigree diagrams for the inheritance of a given characteristic
- Use genetic diagrams to predict the results of monohybrid crosses and calculate phenotypic ratios, limited to 1:1 and 3:1 ratios
- Use Punnett squares in crosses which result in more than one genotype to work out and show the possible different genotypes

### Supplement
- Explain how to use a test cross to identify an unknown genotype
- Explain co-dominance by reference to the inheritance of ABO blood groups – phenotypes being A, B, AB and O blood groups and alleles being IA, IB and Io
- Define a sex-linked characteristic as a characteristic in which the gene responsible is located on a sex chromosome and that this makes it more common in one sex than in the other
18. Variation and selection

### 18.1 Variation

**Core**
- Define variation as differences between individuals of the same species
- Distinguish between phenotypic variation and genetic variation
- State that continuous variation results in a range of phenotypes between two extremes, e.g. height in humans
- State that discontinuous variation results in a limited number of phenotypes with no intermediates, e.g. tongue rolling
- Record and present the results of investigations into continuous and discontinuous variation
- Define mutation as genetic change
- State that mutation is the way in which new alleles are formed
- State that ionising radiation and some chemicals increase the rate of mutation

**Supplement**
- State that phenotypic variation is caused by both genetic and environmental factors
- State that continuous variation is mostly caused by environmental factors
- State that discontinuous variation is mostly caused by genes alone, e.g. A, B, AB and O blood groups in humans
- Define gene mutation as a change in the base sequence of DNA
- Describe the symptoms of sickle-cell anaemia
- Explain how a change in the base sequence of the gene for haemoglobin results in abnormal haemoglobin and sickle-shaped red blood cells
- Use genetic diagrams to show how sickle-cell anaemia is inherited
- State that people who are heterozygous (Hb^S^ Hb^A^) for the sickle-cell allele have a resistance to malaria
- Explain the distribution of the sickle-cell allele in human populations with reference to the distribution of malaria

### 18.2 Adaptive features

**Core**
- Define adaptive feature as an inherited feature that helps an organism to survive and reproduce in its environment
- Interpret images or other information about a species to describe its adaptive features

**Supplement**
- Define adaptive feature as the inherited functional features of an organism that increase its fitness
- Define fitness as the probability of an organism surviving and reproducing in the environment in which it is found
- Explain the adaptive features of hydrophytes and xerophytes to their environments
### 18.3 Selection

**Core**
- Describe natural selection with reference to:
  - variation within populations
  - production of many offspring
  - competition for resources
  - struggle for survival
  - reproduction by individuals that are better adapted to the environment than others
  - passing on of their alleles to the next generation
- Describe selective breeding with reference to:
  - selection by humans of individuals with desirable features
  - crossing these individuals to produce the next generation
  - selection of offspring showing the desirable features

**Pages 238–239**

**Supplement**
- Describe evolution as the change in adaptive features of a population over time as the result of natural selection
- Define the process of adaptation as the process, resulting from natural selection, by which populations become more suited to their environment over many generations
- Describe the development of strains of antibiotic resistant bacteria as an example of evolution by natural selection
- State the differences between natural and artificial selection
- Outline how selective breeding by artificial selection is carried out over many generations to improve crop plants and domesticated animals

**Pages 240–241**

### 19. Organisms and their environments

#### 19.1 Energy flow

**Core**
- State that the Sun is the principal source of energy input to biological systems

**Pages 244–245**

**Supplement**
- Describe the flow of energy through living organisms including light energy from the Sun and chemical energy in organisms and its eventual transfer to the environment

**Pages 244–245**

#### 19.2 Food chains and food webs

**Core**
- Define a food chain as showing the transfer of energy from one organism to the next, beginning with a producer
- State that energy is transferred between organisms in a food chain by ingestion
- Define a food web as a network of interconnected food chains
- Define producer as an organism that makes its own organic nutrients, usually using energy from sunlight, through photosynthesis
- Define consumer as an organism that gets its energy by feeding on other organisms
- State that consumers may be classed as primary, secondary and tertiary according to their position in a food chain
- Define herbivore as an animal that gets its energy by eating plants
- Define carnivore as an animal that gets its energy by eating other animals

**Pages 244–245**
### 19.3 Nutrient cycles

#### Core
- Describe the carbon cycle, limited to photosynthesis, respiration, feeding, decomposition and combustion
- Discuss the effects of the combustion of fossil fuels and the cutting down of forests on the carbon dioxide concentrations in the atmosphere
- Describe the water cycle, limited to evaporation, transpiration, condensation and precipitation

#### Supplement
- Describe the nitrogen cycle in terms of:
  - decomposition of plant and animal protein to ammonium ions
  - nitrification
  - nitrogen fixation by lightning and bacteria
  - absorption of nitrate ions by plants
  - production of amino acids and proteins
  - feeding and digestion of proteins
  - deamination
  - denitrification
- State the roles of microorganisms in the nitrogen cycle, limited to decomposition, nitrification, nitrogen fixation and denitrification (generic names of individual bacteria, e.g. *Rhizobium*, are not required)

### 19.4 Population size

#### Core
- Define population as a group of organisms of one species, living in the same area, at the same time
- Identify and state the factors affecting the rate of population growth for a population of an organism, limited to food supply, predation and disease
- Describe the increase in human population size over the past 250 years and its social and environmental implications
- Interpret graphs and diagrams of human population growth
### Supplement

- Define community as all of the populations of different species in an ecosystem
- Define ecosystem as a unit containing the community of organisms and their environment, interacting together, e.g. a decomposing log, or a lake
- Identify the lag, exponential (log), stationary and death phases in the sigmoid population growth curve for a population growing in an environment with limited resources
- Explain the factors that lead to each phase in the sigmoid curve of population growth, making reference, where appropriate, to the role of limiting factors
- Discuss the reasons for the increase in the size of the human population over the past 250 years

### 20. Biotechnology and genetic engineering

#### 20.1 Biotechnology and genetic engineering

**Core**

- State that bacteria are useful in biotechnology and genetic engineering due to their rapid reproduction rate and their ability to make complex molecules

**Supplement**

- Discuss why bacteria are useful in biotechnology and genetic engineering, limited to:
  - lack of ethical concerns over their manipulation and growth
  - genetic code shared with all other organisms
  - presence of plasmids

#### 20.2 Biotechnology

**Core**

- Describe the role of anaerobic respiration in yeast during production of ethanol for biofuels
- Describe the role of anaerobic respiration in yeast during bread-making
- Investigate and describe the use of pectinase in fruit juice production
- Investigate and describe the use of biological washing powders that contain enzymes

**Supplement**

- Investigate and explain the use of lactase to produce lactose-free milk
- Describe the role of the fungus Penicillium in the production of the antibiotic penicillin
- Explain how fermenters are used in the production of penicillin

#### 20.3 Genetic engineering

**Core**

- Define genetic engineering as changing the genetic material of an organism by removing, changing or inserting individual genes
- State examples of genetic engineering:
  - the insertion of human genes into bacteria to produce human insulin
  - the insertion of genes into crop plants to confer resistance to herbicides
  - the insertion of genes into crop plants to confer resistance to insect pests
  - the insertion of genes into crop plants to provide additional vitamins

### Pages

- Pages 254–255
- Pages 257–257
- Pages 260–261
- Pages 262–263
- Pages 264–265
### Supplement

- Outline genetic engineering using bacterial production of a human protein as an example, limited to:
  - isolation of the DNA making up a human gene using restriction enzymes, forming sticky ends
  - cutting of bacterial plasmid DNA with the same restriction enzymes, forming complementary sticky ends
  - insertion of human DNA into bacterial plasmid DNA using DNA ligase to form a recombinant plasmid
  - replication of plasmid into bacteria (specific detail is not required)
  - replication of bacteria containing recombinant plasmids which make human protein as they express the gene
- Discuss the advantages and disadvantages of genetically modifying crops, such as soya, maize and rice

### 21. Human influences on ecosystems

#### 21.1 Food supply

**Core**

- State how modern technology has resulted in increased food production in terms of:
  - agricultural machinery to use larger areas of land and improve efficiency
  - chemical fertilisers to improve yields
  - insecticides to improve quality and yield
  - herbicides to reduce competition with weeds
  - selective breeding to improve production by crop plants and livestock, e.g. cattle, fish and poultry
- Describe the negative impacts to an ecosystem of large-scale monocultures of crop plants
- Describe the negative impacts to an ecosystem of intensive livestock production

**Supplement**

- Discuss the social, environmental and economic implications of providing sufficient food for an increasing human global population
- Discuss the problems which contribute to famine including unequal distribution of food, drought and flooding, increasing population and poverty

#### 21.2 Habitat destruction

**Core**

- Describe the reasons for habitat destruction, limited to:
  - increased area for food crop growth, livestock production and housing
  - extraction of natural resources
  - marine pollution
- State that through altering food webs and food chains, humans can have a negative impact on habitats
- List the undesirable effects of deforestation as an example of habitat destruction, to include extinction, loss of soil, flooding and increase of carbon dioxide in the atmosphere

**Supplement**

- Explain the undesirable effects of deforestation on the environment

#### 21.3 Pollution

**Core**

- State the sources and effects of pollution of land and water, e.g. rivers, lakes and the sea, by insecticides, herbicides and by nuclear fall-out
- State the sources and effects of pollution of water (rivers, lakes and the sea) by chemical waste, discarded rubbish, untreated sewage and fertilisers  
  Pages 276–277

- Outline the process of eutrophication of water, limited to increased availability of nutrients, increased growth of algae and respiration of decomposing bacteria and lack of oxygen for fish  
  Pages 276–277

- State the sources and effects of pollution of the air by methane and carbon dioxide, limited to the enhanced greenhouse effect and climate change  
  Pages 278–279

### Supplement

- Explain the process of eutrophication of water in terms of:
  - increased availability of nitrate and other ions
  - increased growth of producers
  - increased decomposition after death of producers
  - increased aerobic respiration by decomposers
  - reduction in dissolved oxygen
  - death of organisms requiring dissolved oxygen in water  
  Pages 276–277

- Discuss the effects of non-biodegradable plastics in the environment, in both aquatic and terrestrial ecosystems  
  Pages 274–275

- Discuss the causes and effects on the environment of acid rain  
  Pages 280–281

- State the measures that are taken to reduce sulfur dioxide pollution and reduce the impact of acid rain  
  Pages 280–281

- Explain how increases in carbon dioxide and methane concentrations in the atmosphere cause an enhanced greenhouse effect that leads to climate change  
  Pages 278–279

- Describe the negative impacts of female contraceptive hormones in water courses, limited to reduced sperm count in men and feminisation of aquatic organisms  
  Pages 276–277

### 21.4 Conservation

#### Core

- Define a sustainable resource as one which is produced as rapidly as it is removed from the environment so that it does not run out  
  Pages 282–283

- Explain the need to conserve non-renewable resources, limited to fossil fuels  
  Pages 282–283

- State that some resources can be maintained, limited to forests and fish stocks  
  Pages 282–283

- State that products can be reused or recycled, limited to paper, glass, plastic and metal  
  Pages 282–283

- Outline how sewage is treated to make the water that it contains safe to return to the environment or for human use  
  Pages 284–285

- Explain why organisms become endangered or extinct, limited to climate change, habitat destruction, hunting, pollution and introduced species  
  Pages 286–287

- Describe how endangered species can be conserved, limited to monitoring and protecting species and habitats, education, captive breeding programmes and seed banks  
  Pages 286–287

#### Supplement

- Define the term sustainable development as development providing for the needs of an increasing human population without harming the environment  
  Pages 282–283

- Explain how forests and fish stocks can be sustained using education, legal quotas and re-stocking  
  Pages 282–283

- Explain that sustainable development requires:
  - management of conflicting demands
  - planning and co-operation at local, national and international levels  
  Pages 282–283

- Explain the risks to a species if the population size drops, reducing variation (knowledge of genetic drift is not required)  
  Pages 286–287
Explain reasons for conservation programmes, to include:

- reducing extinction
- protecting vulnerable environments
- maintaining ecosystem functions, limited to nutrient cycling and resource provision, e.g. food, drugs, fuel and genes

Pages 288–289
